TRUST, TRANSPARENCY, AND AI

Building Responsible Scholarship Review Practices

Miguel Guhlin

NSPA 2026 · San Antonio
October 21, 2026
60-minute workshop

AI-generated image · fictional people

A quick pulse

Where is your organization today?

AI in review

Do you use it anywhere in the process?

A written applicant policy

Do applicants know the rules?

Your one-word response

How do you feel about AI in review?

Hands, a poll, or a brief conversation all work

Our 60-minute route

Five connected conversations, all aimed at defensible decisions

SESSION MAP

Five connected conversations · one standard: explainable scholarship decisions

Two perspectives, one standard: decisions people can explain.

The balancing act

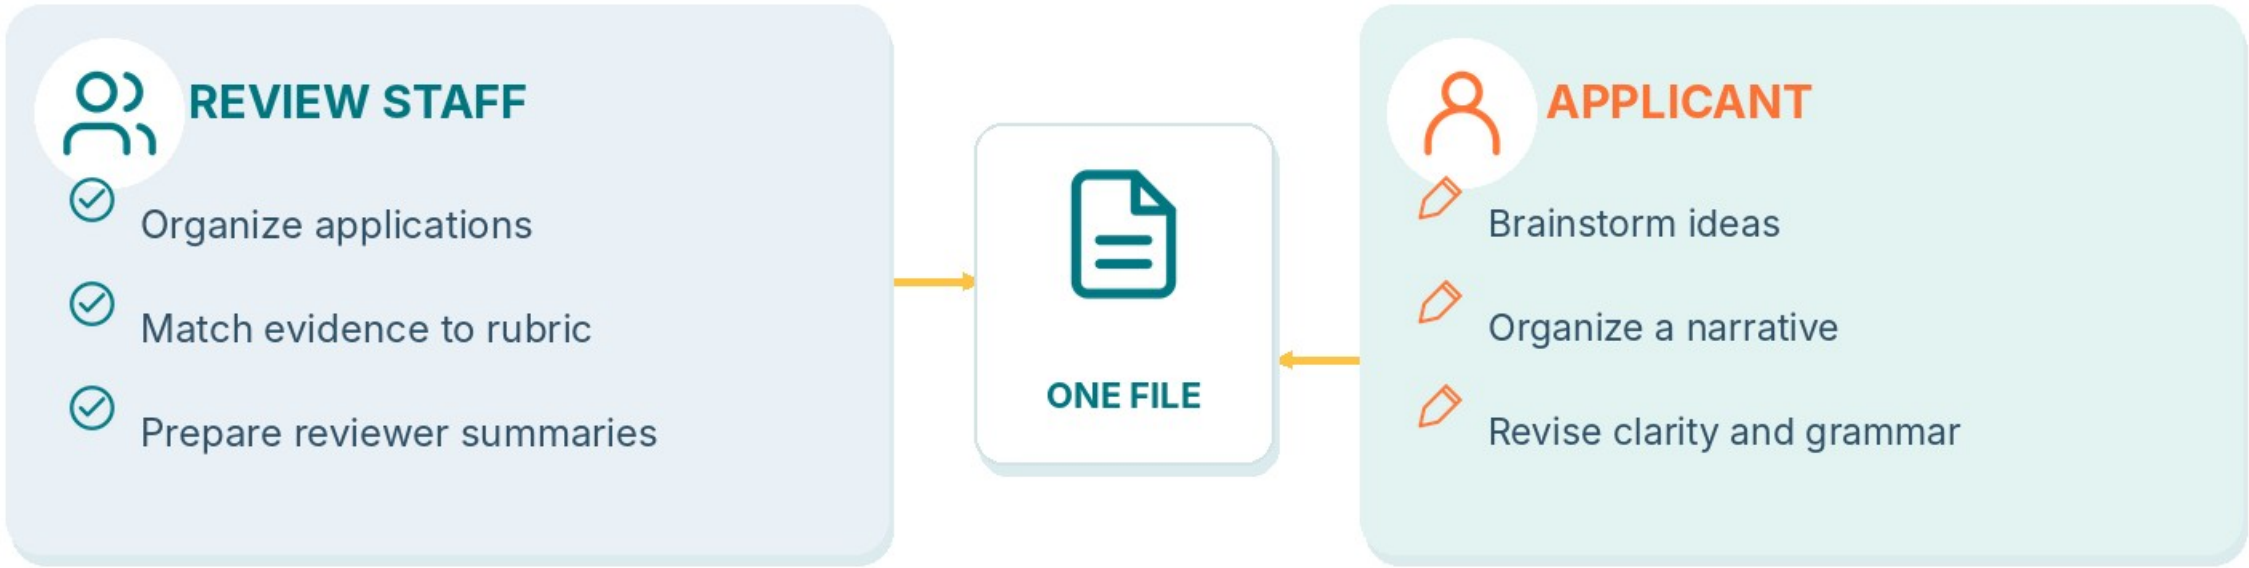

Speed and consistency matter, but so do fairness and authenticity

A faster process is useful only if the result remains fair and explainable.

Two sides of one application

Review staff and applicants may both turn to generative AI

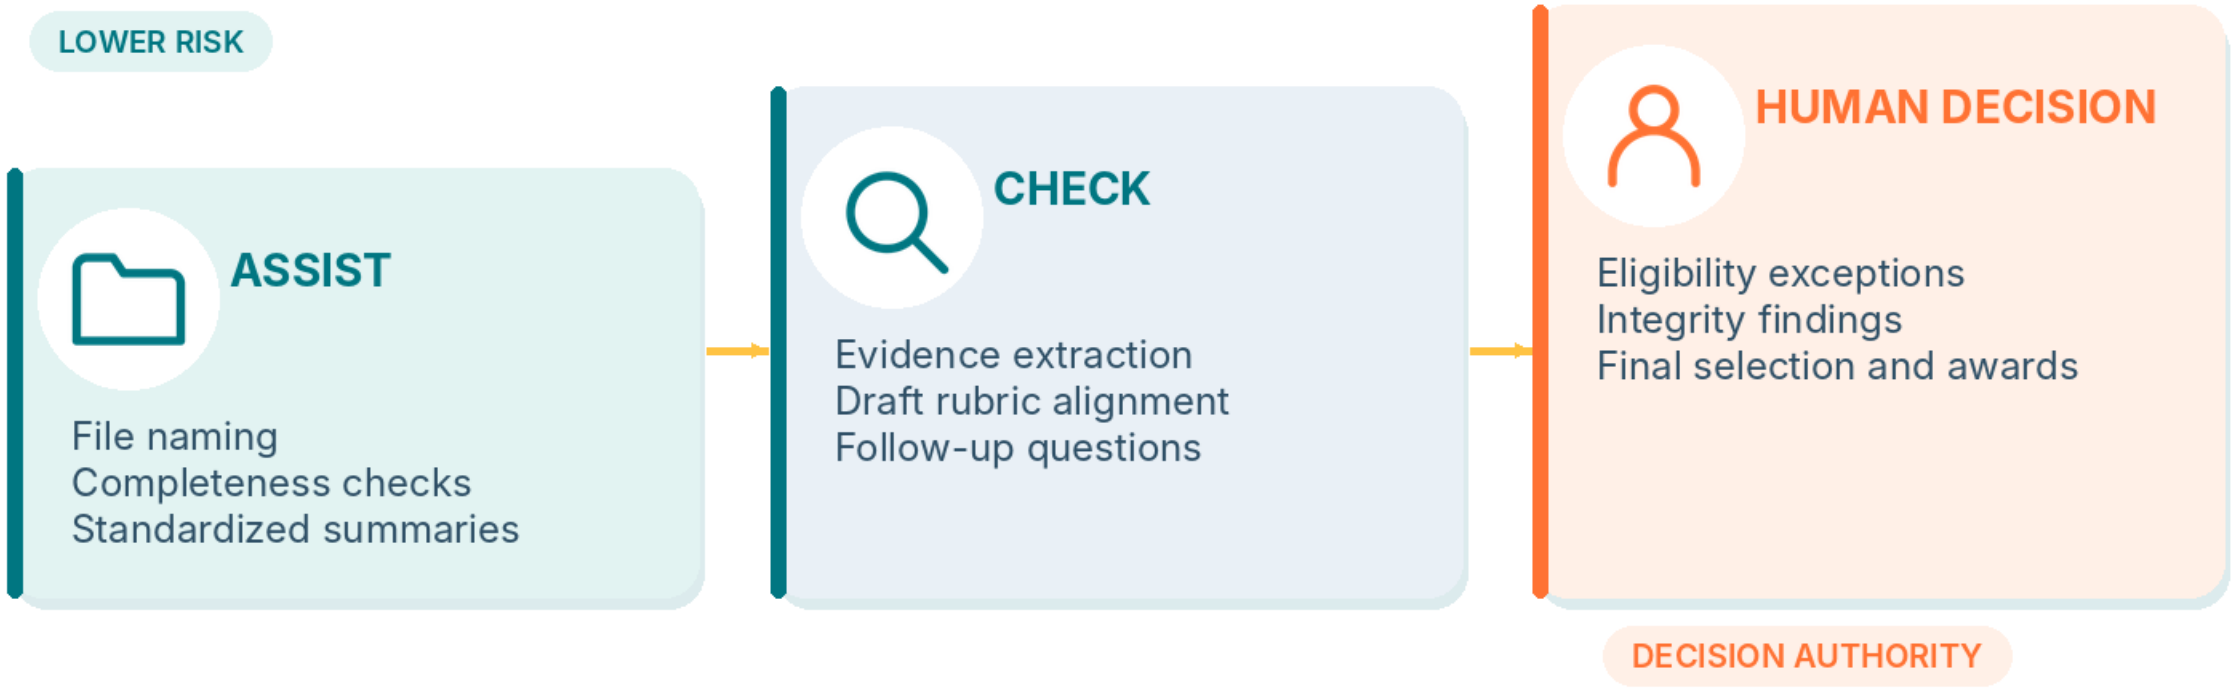

Rules should be clear to people on both sides of the application.

Write rules that make sense from both sides of the application.

Assist, check, or reserve for people

Different tasks deserve different levels of control

AI can prepare review information; people remain accountable for decisions.

Build a prompt that can be checked

A strong prompt makes the task, criteria, and limits visible

The prompt should tell the model what evidence it may and may not use.

From a vague request to a review prompt

Control what the model considers and how it reports

VAGUE

“Read these essays and pick the best applicants.”

STRUCTURED

SOURCE	Fictional application + supplied rubric
EVIDENCE	Quote text for each criterion
UNCERTAINTY	Flag missing or conflicting details
LIMIT	No award recommendation

Specificity supports consistency; verification still belongs to staff.

Rubrics come before model output

Evaluation criteria must be decided by people first

PUBLISHED CRITERION	EVIDENCE TO FIND	HUMAN CHECK
Community engagement	Specific contribution and scope	**Is the evidence relevant?**
Learning and persistence	Actions taken and progress	**Are the claims supported?**
Goals and plans	Realistic plan tied to experience	**Does it meet the rubric?**

Rubric decisions belong to people before the model runs

A rubric should reward evidence of the criterion, not the polish of the prose.

Try it: repair the weak prompt

Small-group or paired discussion

> **“Review all applications and choose the strongest students.”**

01 CRITERIA

What published rubric applies?

02 BOUNDARY

What may AI not infer or decide?

03 VERIFICATION

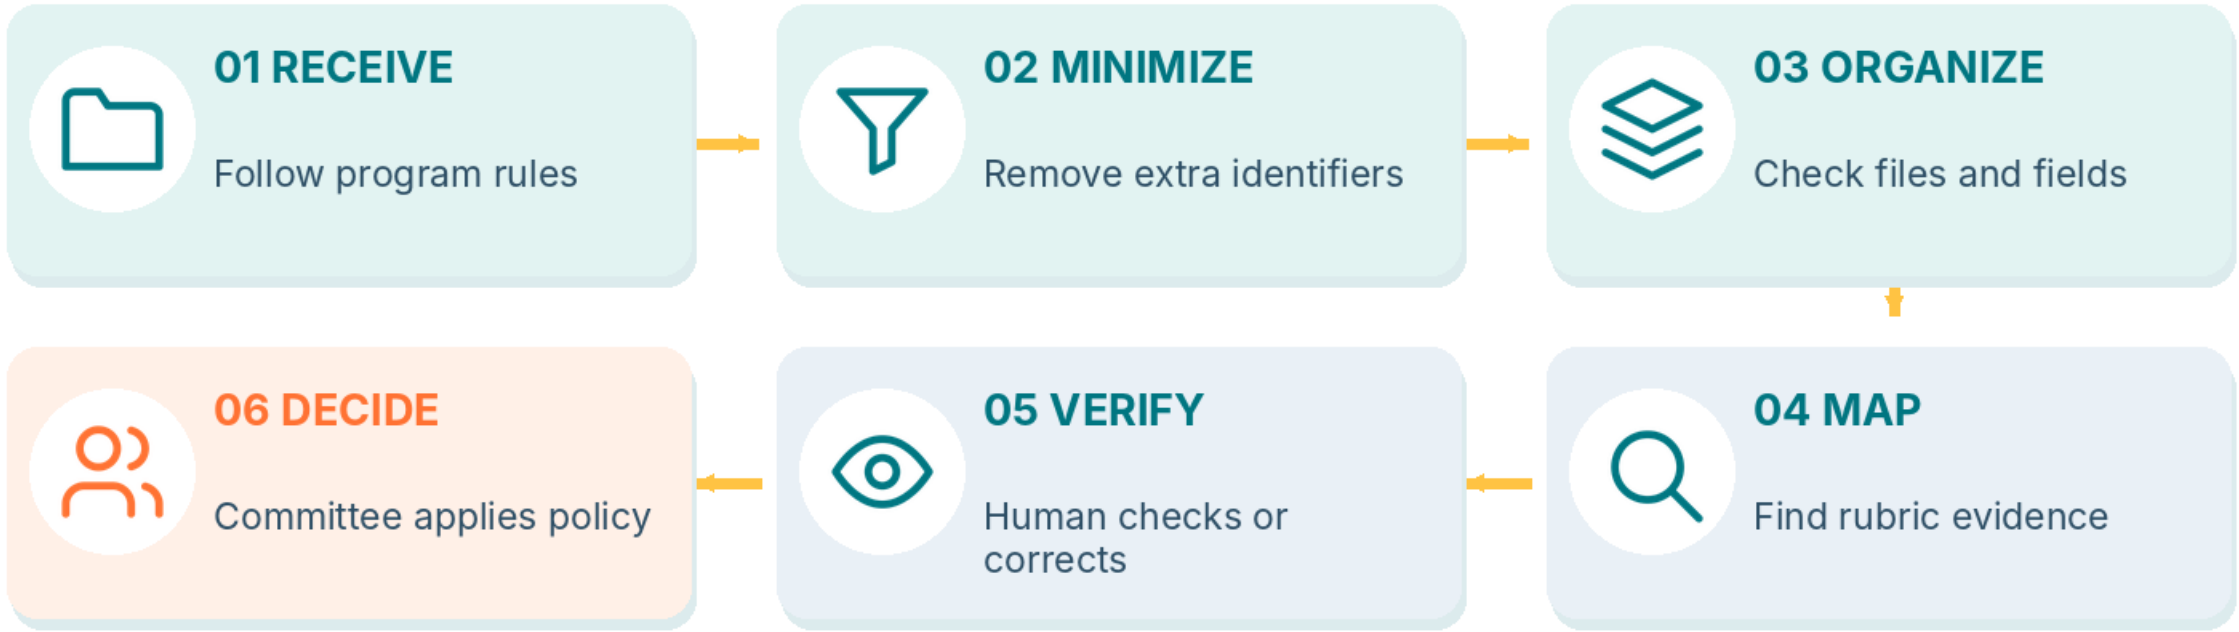

How must it show evidence?

ADD ALL THREE TO REPAIR THE PROMPT

Add one criterion, one boundary, and one verification requirement.

A review workflow you can explain

Six stages, with people responsible at the decision points

Data minimization, evidence checks, and human decisions are workflow steps.

Demo 1: administrative review

Fictional file inventory; no actual applicant records

FICTIONAL FILE INVENTORY

ID	FILES RECEIVED	POSSIBLE ISSUE
A17	Essay + transcript	⚠ Reference missing
B24	All 3 required items	✓ No gap found
C09	Essay + reference	⚠ Transcript missing

2

records to check

Staff confirms exceptions

AI may flag missing items; a person confirms requirements and exceptions.

Demo 2: map rubric evidence

Fictional applicant excerpt and a human-authored criterion

FICTIONAL EXCERPT

“I organized 12 weekend tutoring sessions for sixth graders.”

COMMUNITY ENGAGEMENT

2/3
DRAFT

Rubric anchor 2:
Specific contribution

Reviewer checks impact and the actual rubric.

Fictional draft · Never an automatic award decision

A draft rubric match is a starting point for review, not a final score.

Demo 3: prepare a reviewer handoff

Bring together evidence, its source, and the open question

TRACEABLE HANDOFF

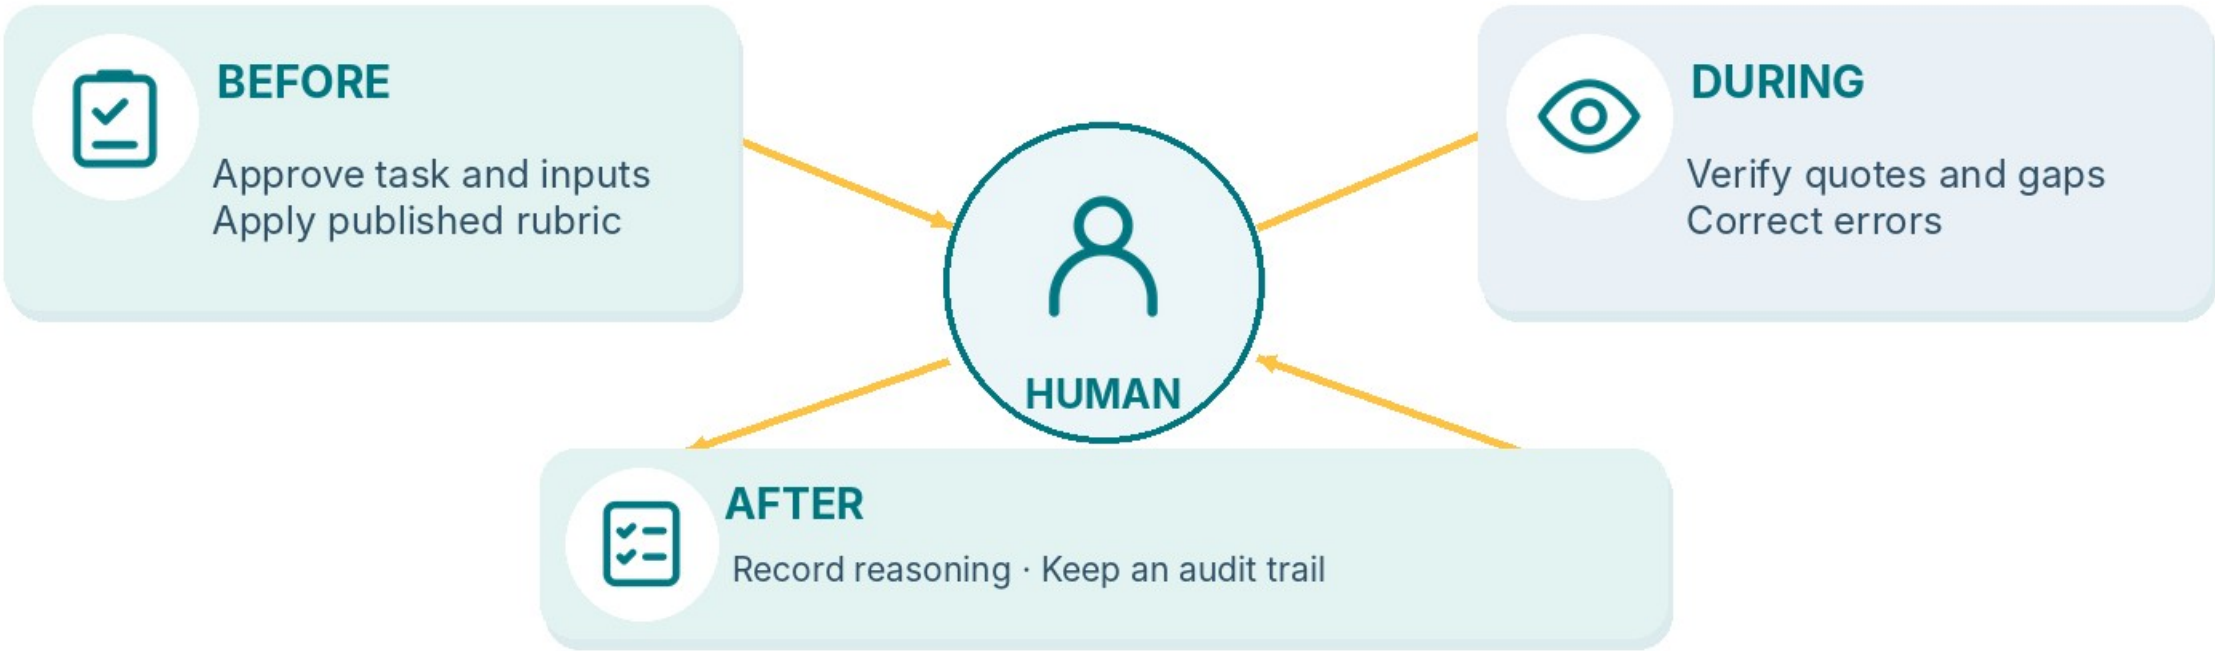

RUBRIC CRITERION	SOURCE EVIDENCE	REVIEWER QUESTION
Engagement	Essay: “12 tutoring sessions”	What was the applicant’s role?
Goals	Plan: “Study community health”	Is the plan specific enough?
Eligibility	Transcript listed as received	Verify the required record

The handoff shows what was found, where it came from, and what remains unknown.

A useful handoff makes uncertainty visible instead of hiding it.

Keep a person in the loop

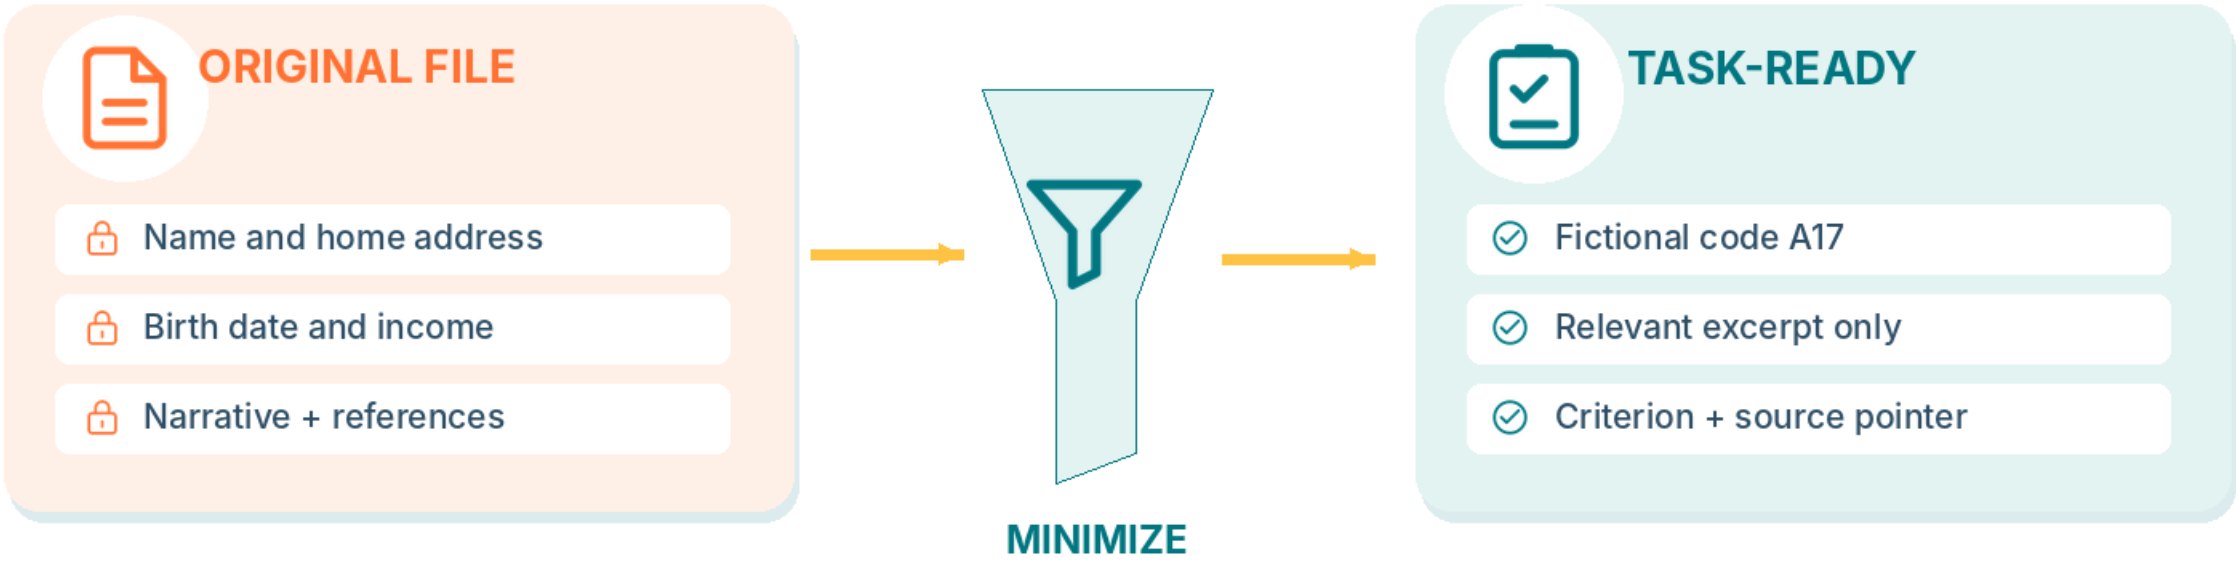

Specify where reviewers inspect and correct AI-assisted work

Document the final reasoning, not just the model's draft response.

Protect information before the prompt

Remove data that the task does not require

Only approved systems may receive actual applicant data

Even minimized information must go only into approved systems.

Security starts before the upload

Approval and access rules matter more than a polished interface

If a tool is not approved for applicant data, do not use applicant data in it.

Consistency does not guarantee fairness

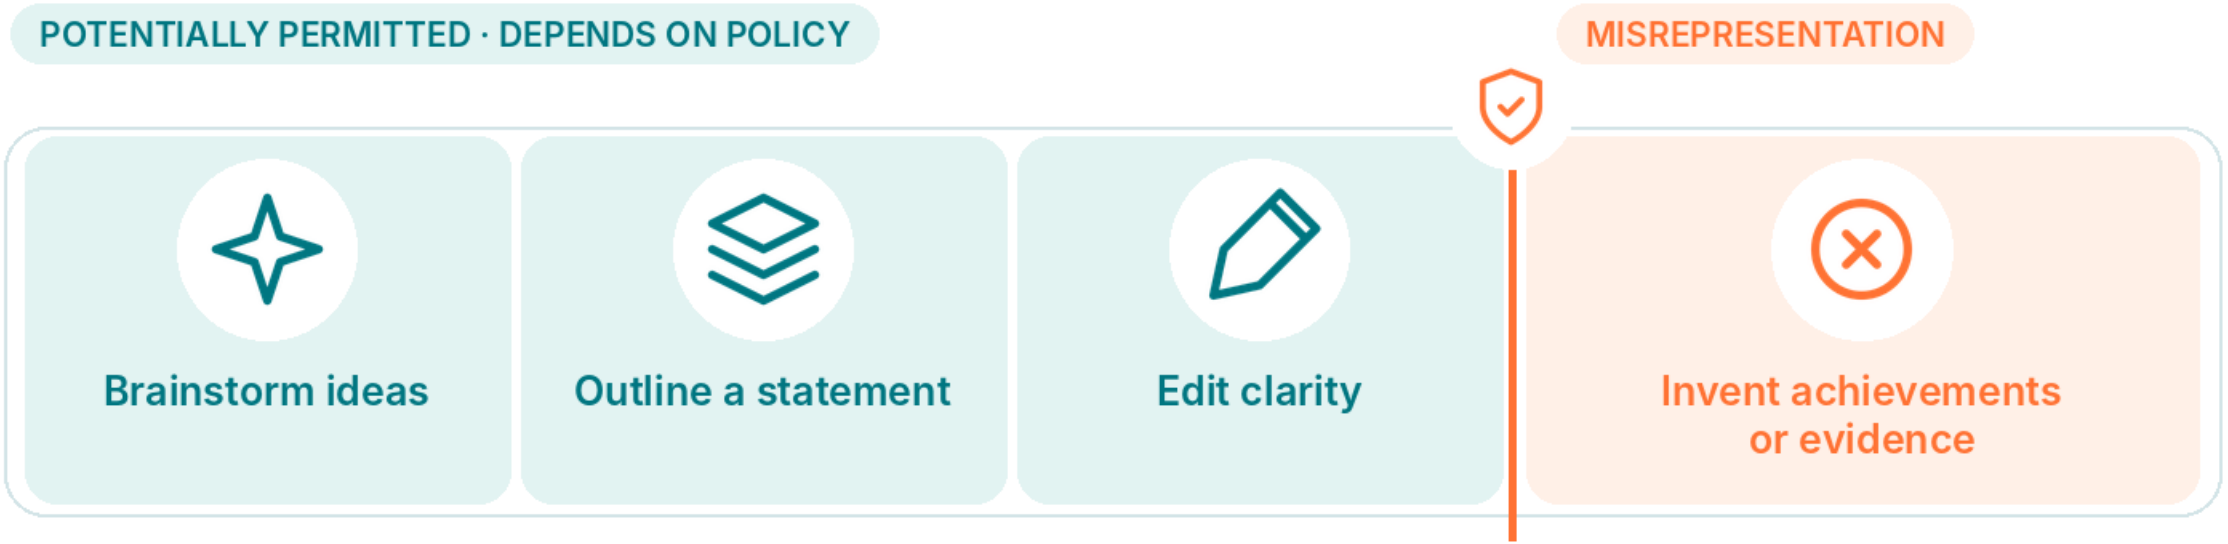

Test the workflow with diverse fictional examples and multiple reviewers

Compare outcomes, challenge assumptions, and recalibrate before scaling.

Applicants use AI, too

Policies should distinguish assistance from misrepresentation

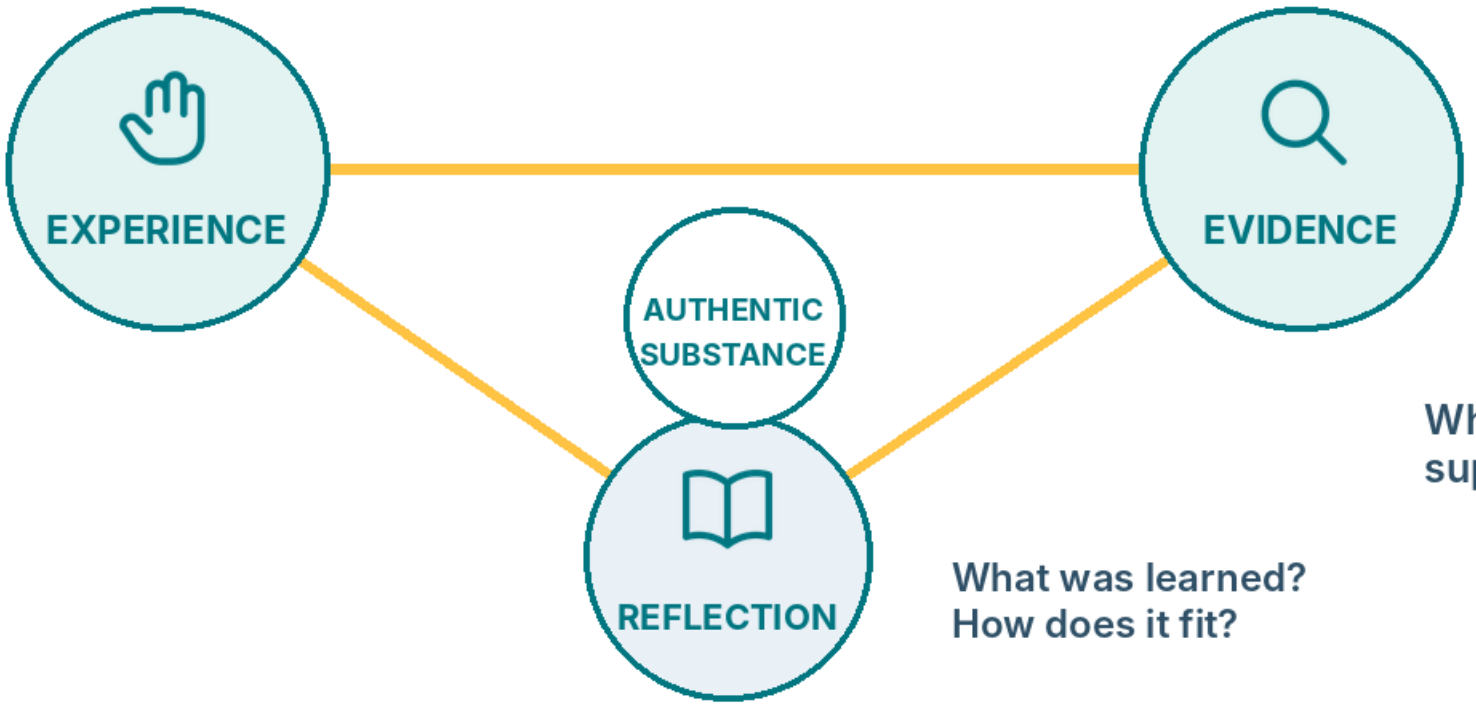

The policy must define permissible assistance before the application is submitted.

Judge the truthful substance of an application under a published rule.

Assess substance, not the writing style

Use the same authentic-evidence questions for every applicant

An applicant should be assessed on claims and evidence, not detector labels.

AI detection is not proof of authorship

Scores can misclassify human text or miss AI-assisted text

DETECTOR OUTPUT	FLAGGED AS AI	NOT FLAGGED
HUMAN WRITTEN	**FALSE POSITIVE** Human text falsely flagged	**NO FLAG** Cannot prove authorship
AI ASSISTED	**FLAG** Does not prove authorship	**FALSE NEGATIVE** AI-assisted text not flagged

Detector labels are imperfect signals, never proof or a sole basis for denial.

Do not deny a scholarship solely because a detector flags a response.

A flagged essay: what would you do?

Scenario discussion: a fictional narrative triggers an AI detection flag

A fictional essay is flagged, but activities and references are consistent.

A · REJECT

Treat the detector score as proof

B · IGNORE

Discard every concern without review

C · REVIEW

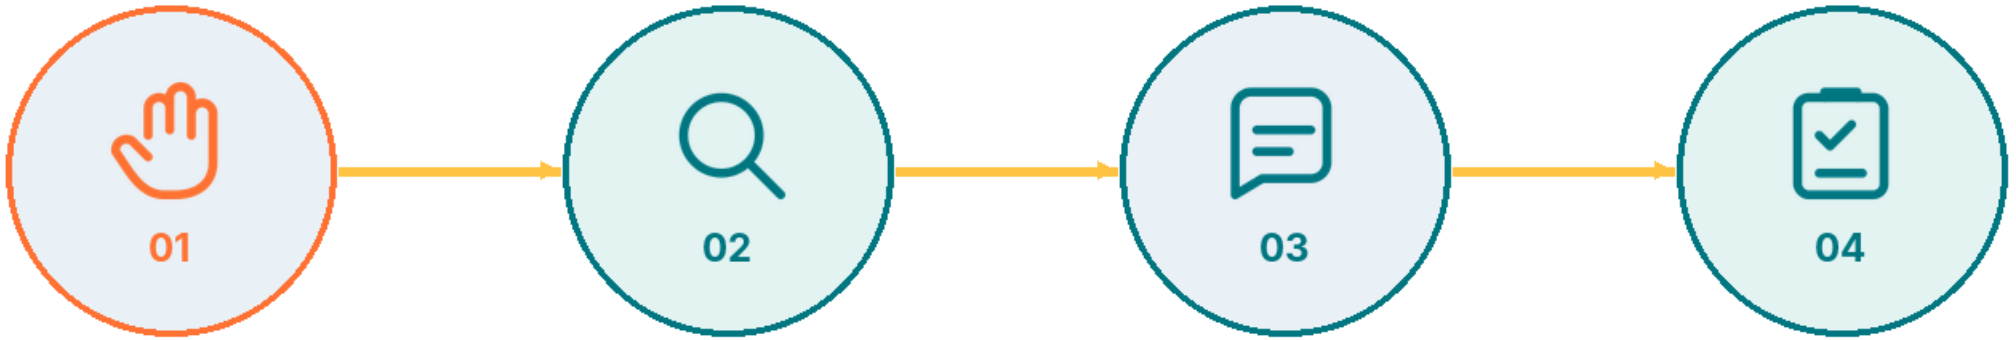

Check evidence, rules, and explanation

PROPORTIONATE RESPONSE

A score can initiate a careful review, not decide its outcome.

A fair response to an AI concern

Use the same process, standards, and opportunity to respond

PAUSE
No automatic penalty

CHECK
Review policy + records

INVITE
Allow fair clarification

DOCUMENT
Rationale + appeal path

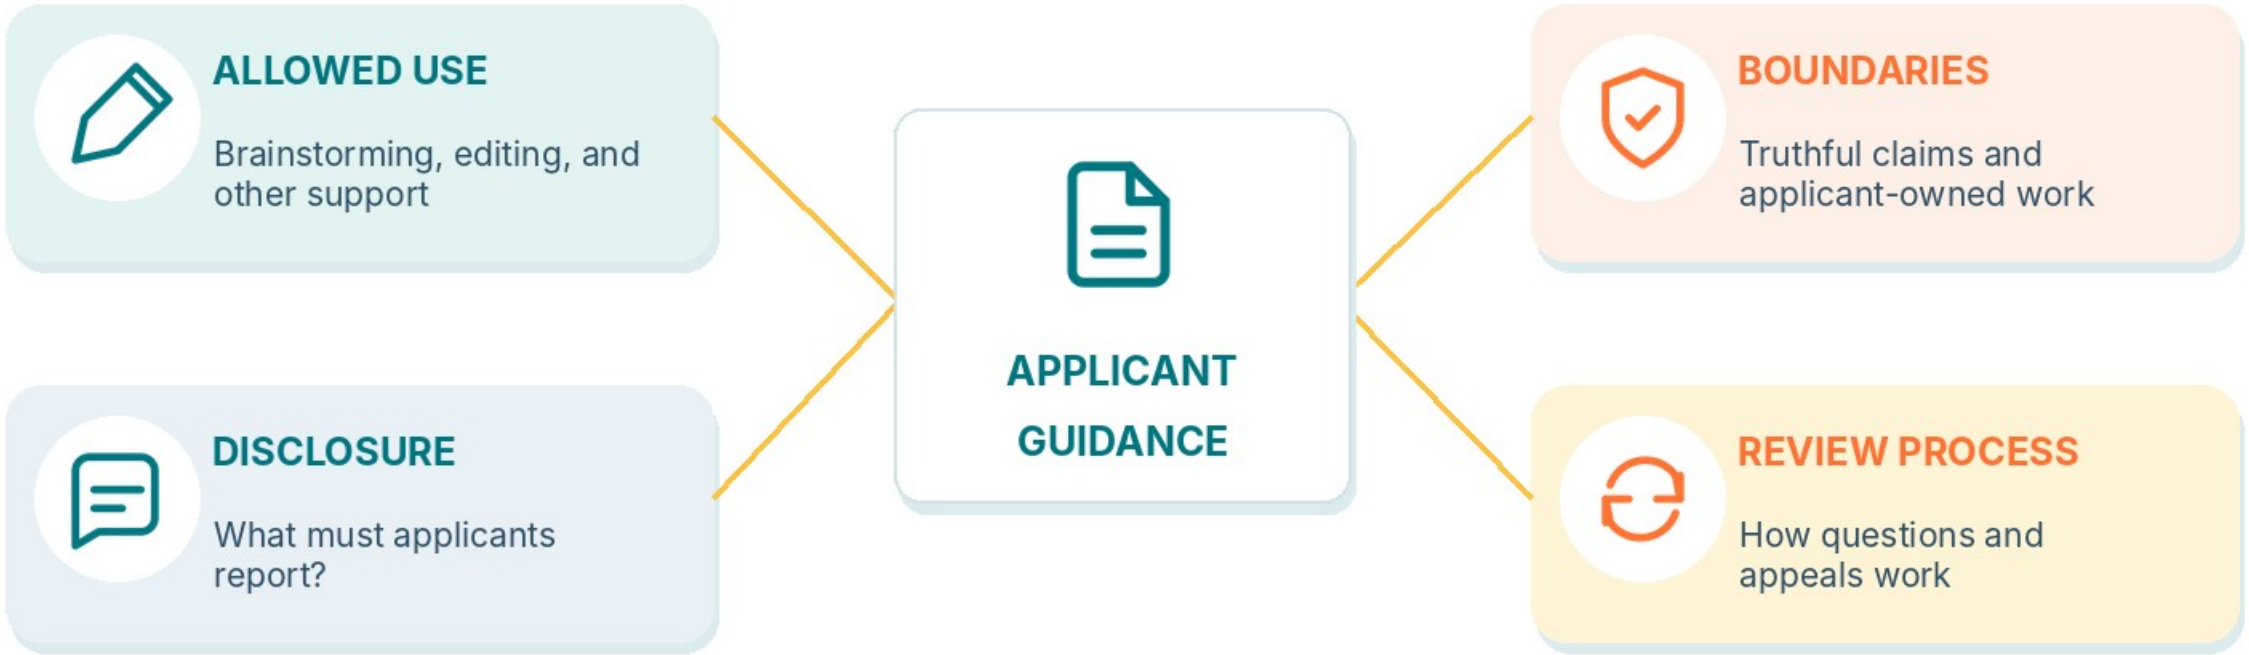

Same standards · Evidence first · Opportunity to respond · Human decision

---

Every concern needs evidence, proportionality, and a recorded human decision.

Make the applicant policy readable

Tell people the rules before they apply

Clear rules reduce confusion, surprise restrictions, and inconsistent enforcement.

Compare policy language

A usable rule is more specific than “AI use is discouraged”

UNCLEAR RULE

“AI-generated applications may be disqualified.”

CLEARER ILLUSTRATIVE RULE

You may use AI to brainstorm or proofread.
Your experiences and accomplishments must be truthful.
Follow any disclosure instructions.
A detector score alone will not decide eligibility.

Publish the rules before submission, then apply them consistently.

Write staff-facing rules, too

Applicants should not be the only people governed by an AI policy

An internal protocol should say who can use AI, for which tasks, with what review.

Workshop: decide your local rules

Choose one answer for each policy question

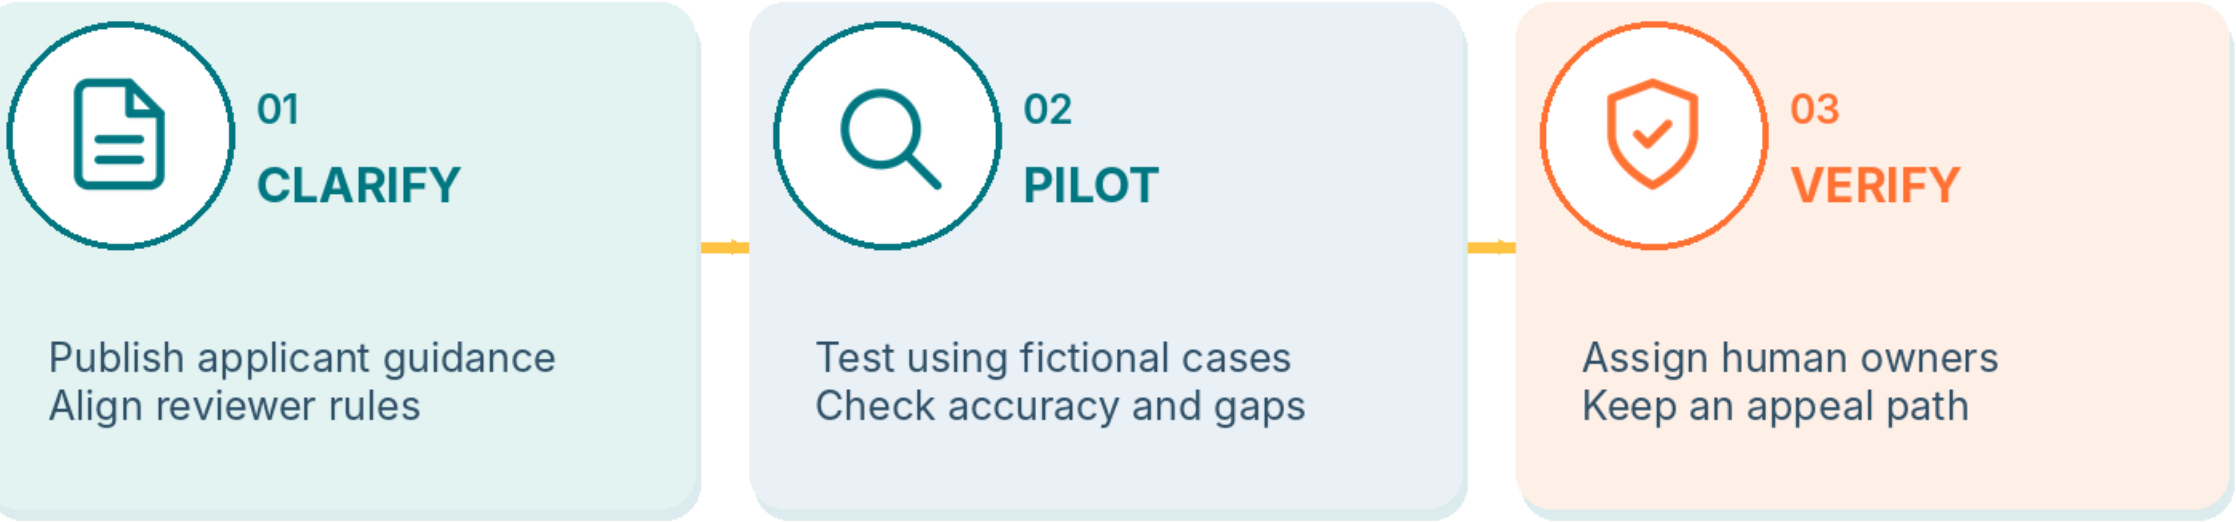

APPLICANT USE	→	Which help is permitted? Must it be disclosed?	○
REVIEWER USE	→	Which tasks can an approved tool support?	○
FAIR RESPONSE	→	What evidence and appeal process applies?	○

Mark the choices your organization still needs to make

Leave with a policy choice your team can discuss, not just a slogan.

Bring it into your next review cycle

Three practical implementation moves

Pilot on invented records before considering any authorized production workflow.

Pilot the workflow and refine it before applying it to real applicant data.

What will you change first?

One workflow, one safeguard, one policy decision

BEFORE YOUR NEXT APPLICATION CYCLE

WORKFLOW	One task AI may assist
SAFEGUARD	One check a person must perform
POLICY	One rule applicants should know

TAKE THIS BACK

Responsible AI use means that applicants and reviewers can understand the rules.

Backup: reusable reviewer prompt

For fictional or explicitly approved, minimized review materials only

TASK	Compare excerpt with one published criterion
SOURCE	Use only supplied text and rubric; no assumptions
OUTPUT	Criterion · Quoted evidence · Gaps · Reviewer question
LIMITS	No personal attributes or award recommendation
CHECK	Label uncertainty; human verifies every finding

No application outcome may be based solely on this draft output.

Backup: sources and further reading
